

Food Orders Data Analysis

Michael O. Aboagye

PROBLEM STATEMENT

A food delivery service seeks to optimize its business operations, particularly in logistics, with the goal of reducing delivery times.

The company requires actionable insights on key focus areas to enhance delivery efficiency and improve overall customer satisfaction.

Rider Wait Time

The chart indicates predominantly low rider wait times, suggesting that the delivery operations are generally efficient.

Rider Wait Time Distribution

The trend of count of Typical wait time

KPT (Kitchen Preparation Time)

The histogram illustrates the typical duration of kitchen preparation times, providing insights into the efficiency of kitchen operations.

KPT Duration (Kitchen Prep Time) Distribution

Rider Wait Time Vs. KPT

Rider Wait Time vs Prep Duration

Relationship between rider wait time and kitchen prep duration.

The scatter plot shows a clear positive relationship between Kitchen Prep Duration and Rider Wait Time, indicating that longer preparation times are associated with increased rider waiting. This provides insight into how these factors impact overall delivery efficiency.

Delivery Distance

The bar graph highlights the most common delivery distance categories covered by riders, providing insights into typical delivery patterns.

Order Status Count

The chart displays the percentage distribution of food order statuses, offering insights into the ordering process and highlighting areas for improvement to enhance overall efficiency.

Ratings

Average Rating per Restaurant

Average of Customer Rating for each Restaurant name.

The bar chart presents the average customer rating for each restaurant, providing insights into the top-performing establishments.

Customer Complaint

Common Customer Complaint Tags

The pie chart illustrates the frequency of each customer complaint category, highlighting key areas for operational improvement to enhance customer satisfaction.

No. Of Orders By Restaurants

The chart displays the most popular restaurants based on the number of orders, providing a clear view of top performers. Aura Pizzas leads with 69% of orders, followed by Swaad at 29%.

Revenue By Restaurant

It is evident that restaurants with the highest number of orders also generate the largest revenue.

Key Takeaways

- Kitchen preparation time contributes more to delivery delays than travel distance.
- Delivery times peak during evening hours, indicating higher demand periods.
- Rider wait times are longest at high-volume restaurants with slower workflows.
- Even short-distance deliveries experience delays due to kitchen bottlenecks.
- Customers exhibit strong loyalty to restaurants that consistently maintain fast service, as reflected in ratings.
